

Operational Assessment Report – Customer Service & Retrieval Process Findings

Prepared from stakeholder discussions and process walkthrough observations.

Executive Overview

This assessment focuses on understanding current operational challenges, customer experience issues, communication gaps, and role responsibilities within the customer service and retrieval process. The objective is to document existing pain points without proposing solutions.

Customer Experience Findings

Customers frequently lack visibility in the status of their requests. Repeated follow-ups, reminders, and escalations are common. Communication varies by employee and customer relationship, resulting in inconsistent customer experiences. Customers often perceive that reminders are necessary to obtain updates.

Employee Activity Observations

Employees spend significant time tracking requests, responding to emails, attending calls, checking status manually, and coordinating between teams. Administrative follow-ups often consume substantial effort in addition to actual request fulfillment activities.

Communication Challenges

Requests arrive through multiple channels. Communication practices are not consistently followed across all requests. Customers may receive acknowledgments, status updates, or closure notifications inconsistently. Multiple email IDs are being monitored for similar activities.

Operational Process Gaps

Request information is spread across email, applications, spreadsheets, and manual records. Tracking the complete lifecycle of a request often requires manual effort. Status verification frequently depends on contacting individuals rather than referencing a single source.

Retrieval Process Challenges

Retrieval requests may involve partial retrievals, missing files, misplaced cartons, scanning issues, or multiple rounds of customer clarification. A single retrieval request can generate numerous emails, reminders, calls, and escalations.

Role & Responsibility Observations

Customer service personnel manage request intake, customer communication, escalations, coordination, and status updates. Retrieval coordinators verify authorization, manage retrieval activities, coordinate with warehouse staff, and communicate progress. Responsibilities overlap, creating additional communication and coordination workload.

Customer Segments Mentioned During Discussions

Axis Bank, IndusInd Bank, and IDFC Bank generate comparatively higher interaction volumes due to branch network size and frequent follow-ups. Certain customers generate substantially higher email and call traffic than others.

Key Findings

1. High volume of repeated customer follow-ups.
2. Significant manual effort spent on status communication.
3. Inconsistent communication practices.
4. Multiple communication channels and email IDs.
5. Dependency on manual tracking and individual knowledge.
6. Duplicate updates across systems.
7. Escalations consume significant operational time.
8. Lack of end-to-end visibility across request lifecycle.

Conclusion

The assessment indicates that operational effort is heavily influenced by communication, tracking, and coordination activities. Customer concerns primarily relate to visibility, responsiveness, and status updates, while employees face challenges related to manual monitoring, multiple communication channels, repetitive follow-ups, and fragmented process ownership.
